

Wow...things are certainly happening faster than I expected. As January kicked off the new year, I posted my <u>outlook for 2016 in which I discussed</u> why, despite views of Goldman Sachs and many others, interest rates were going lower rather than higher.

"With the Federal Reserve raising interest rates on the short-end (Fed Funds), it will likely push the long-end of the curve lower as the economy begins to slow from the effects of monetary policy tightening. From a purely technical perspective, rates have been in a long-term process of a tightening wedge. A breakout to the upside would suggest 10-year treasury rates would soar to 3.6% or higher, the consequence of which would be an almost immediate push of an economy growing at 2% into recession. The most likely path, given the current economic and monetary policy backdrop, will be a decline in rates toward the previous lows of 1.6-1.8%. (Inflation will also remain well below the Fed?s 2% target rate for the same reasons.)"

"Of course, falling rates means the ongoing *?bond bull market?* will remain intact for another year. In fact, if my outlook is correct, bonds will likely be one of the best performing asset classes in the next year."

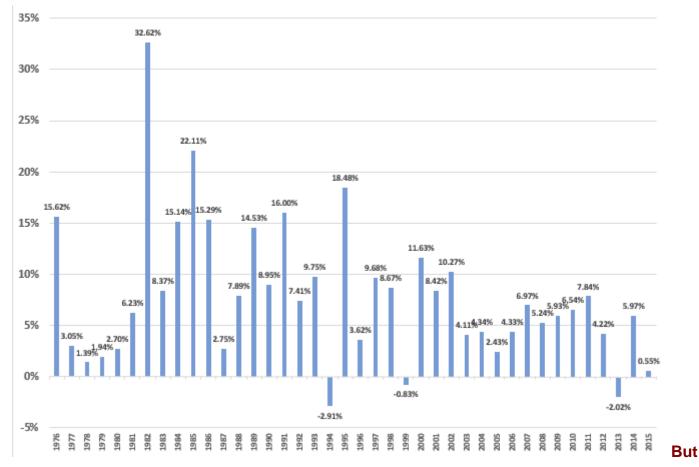

With interest rates now at my target levels in February, and bonds now extremely overbought, this is an opportune time to take some profits out of interest rate sensitive investments. However, what the plunge in rates also suggests is that the economy is FAR weaker than Ms. Yellen, the mainstream financial media or the bullish blogosphere realize. Unfortunately, by the time the economic data is revised to reveal what rates are already telling you, it will be far too late to protect your investment capital. But that is just my view. This weekend's reading list, as usual, is a compilation of reads•that provide both sides of the market and economic debate. Our job, as investors, is to reduce our confirmation bias in order to make more logical decisions with our money even though our emotions may be trying to lead us elsewhere. Hope, optimism and greed are all emotions that have led to far greater destructions of capital than negativity and fear ever have.•

"How many hedge fund managers would kill for the following performance characteristics over a 40-year time frame?

Annual Returns: 7.7%

• Volatility: 6.9%

Number of Up Years: 37Number of Down Years: 3

?I was far too bullish last December," Siegel admitted, referring to his call on "Squawk Box" that "valuations can stay on the high side." He also had predicted on CNBC in November that Dow 20,000 was a "real possibility" in 2016. It was above 15,900 on Monday. The Wharton School finance professor on Monday summed up his view on the headwinds to the market. "Those deflationary forces ... from China, from commodities are really, in the presence of debt that so many of these energy and other companies have, ... causing the market turmoil right now."

?The weakness in global risk assets that started in May 2015 raises a major question for macro-economists. Is market turbulence foreshadowing? or perhaps causing? a

much broader weakening in global economic activity than anything seen since 2009? Until now, the Fulcrum activity nowcasts have failed to identify a major turning point in global growth. This conclusion is still just about intact, but is subject to much greater doubt in this month?s report. There are some signs that growth in the advanced economies may be fraying at the edges, and China may be embarking on another mini downturn.?

5) Why Stocks Could Fall By 10-20% by Jack Bouroudjian via CNBC

?The market tone began to shift in December ? and the warning signals started to flash red. We started to witness a contraction in earnings for a couple of quarters in a row, which resulted in the price-to-earnings ratio of the S&P 500 getting rich. We watched crude oil have a parabolic move to the downside as producers couldn't pump fast enough. And we started to see the Federal Reserve move rates at a time when all the other central banks were doing the exact opposite which created risk aversion. As it turns out, this became an I.O.U. market: interest rates, oil and uncertainty."
