## The "QE, Not QE" Rally Is On

Just recently, we released a study for our *RIAPro Subscribers (30-Day Free Trial)* on historical

QE programs and what sectors, • markets, and commodities perform best.(*If you subscribe for a 30-day Free Trail you can read the entire report* "**An Investor's Guide To QE-4.**")

"On October 9, 2019, the Federal Reserve announced a resumption of quantitative easing (QE). Fed Chairman Jerome Powell went to great lengths to make sure he characterized the new operation as something different than QE. Like QE 1, 2, and 3, this new action involves a series of large asset purchases of Treasury securities conducted by the Fed. The action is designed to pump liquidity and reserves into the banking system. Regardless of the nomenclature, what matters to investors is whether this new action will have an effect on asset prices similar to prior rounds of QE. For the remainder of this article, we refer to the latest action as QE 4. To quantify what a similar effect may mean, we start by examining the performance of various equity indexes, equity sectors, commodities, and yields during the three prior

As you

will notice, all major markets increased in value during QE-1, 2, and 3. Since the market increased each time the Fed engaged in monetary programs, it should **not be surprising investors now have a** <u>"Pavlovian"</u> **response to the Fed** "*ringing the bell.*" • Over the last month, we have been discussing the end of the year rally which would be supported by both the Fed, and a "*trade deal.*" • This past week, as expected, headlines were floated which suggested that tariffs would be reduced in exchange for essentially nothing, This is precisely the case we laid out in September:

2.52%

2.34%

1.99%

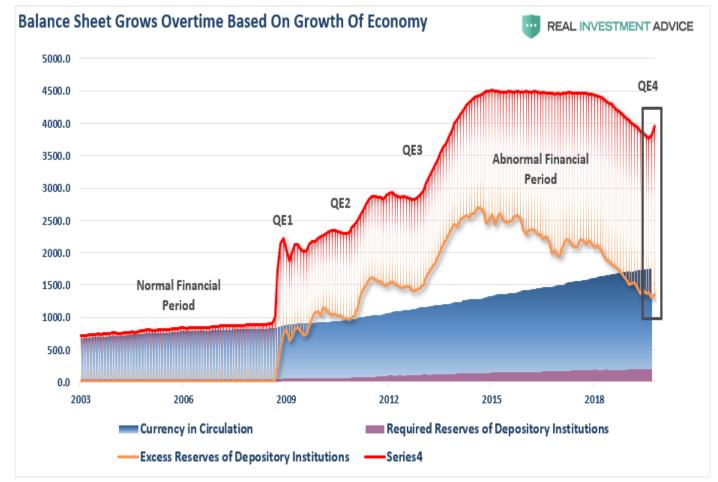

"Trump can set aside the last 20%, drop tariffs, and keep market access open, in exchange for China signing off on the 80% of the deal they already agreed to.•For Trump, he can spin a limited deal as a ?win? saying ?China is caving to his tariffs? and that he ?will continue working to get the rest of the deal done.? He will then quietly move on to another fight, which is the upcoming election, and never mention China again.•His base will quickly forget the ?trade war? ever existed.Kind of like that ?Denuclearization deal? with North Korea.?

We followed that in early October by laying out the case for the *"trade deal"* to push the *markets to* <u>3300:</u>

"Assuming we are correct, and Trump does indeed ?cave? into China in mid-October to get a ?small deal?•done, what does this mean for the market. The most obvious impact, assuming all ?tariffs? are removed, would be a psychological ?pop? to the markets which, given that markets are already hovering near all-time highs, would suggest a rally into the end of the year.?

Then, just two week's ago, as the Fed went into action:

"Clearly, the Fed is concerned about something other than the impact of 'Trump?s Trade War' on the economy. In the meantime, **the injection of liquidity continues to support asset prices as the litany of 'algo?s' which drive -80% of the trading on Wall Street, respond to more liquidity.**"

That is where we are today. The questions now are:

- 1. How do you play it; and,
- 2. What happens next?

### How To Play It

As we have been noting over the last month, with the•Fed's more accommodative positioning, we continue to maintain a long-equity bias in our portfolios currently. We have reduced our hedges, along with some of our more defensive positioning. We are also adding opportunistically, to

our equity allocations, even as we carry a slightly higher than normal level of cash along with our fixed income positioning. Currently, it will likely pay to remain patient as we head-into the end of the year. With a big chunk of earnings season now behind us, and economic data looking weak heading into Q4, the market has gotten a bit ahead of itself over the last two weeks. On a short-term basis, the market is now more than 6% above its 200-dma. These more extreme price extensions tend to denote short-term tops to the market, and waiting for a pull-back to add exposures has been prudent.

Also, the majority of our indicators are back to more extreme overbought readings, which have typically denoted short-term tops at a minimum. As I noted last week:

# "Given the markets tend to pullback just before Thanksgiving, and during the second week of December, we will have a better opportunity increase allocations if we are patient."

Once we see that pullback, or even a slight consolidation of the recent advance, we can increase allocations in portfolios towards more equity related exposure. *This begs the question of "what to buy,"*which•brings us back to our recen RIAPRO.NET article:

"If we assume that assets will perform similarly under QE 4, we can easily forecast returns using the normalized data from above. The following three tables show these forecasts. Below the tables are rankings by asset class as well as in aggregate. For purposes of this exercise, we assume, based on the Fed?s guidance, that they will purchase \$60 billion a month for six months (\$360 billion) of U.S. Treasury Bills. The expected top five performers during QE4 on a normalized basis from highest to lowest are: Silver, S&P 400, Discretionary stocks, S&P 600, and Crude Oil.•

### What Happens Next?

### Michael Lebowitz, CFA recently penned:

"A Honus Wagner baseball card from 1909 was recently auctioned for over \$3 million. While that may seem like a lot of money, it is not necessarily expensive. A baseball card is nothing more than paper and ink with no real value. Its street value, or price, is based on the whims of collectors. "Whim" is impossible to value. Stocks are not baseball cards. Stocks represent ownership in a corporation, and therefore, their share prices are based on a future series of expected earnings and cash flows. Further, there are many other types of investments that serve not only as alternatives, but provide a means to assess relative value. Today, investors are trading stocks on a "whim," with scant attention to their value. Unlike a baseball card, when a stock's street value rises much more than its real value, an inevitable correction will occur. The only question is not if but when will investors realize what they are truly buying."

There is an important distinction to be made here between *"investing"* vs. *"speculating."* Benjamin Graham, in his seminal work *Security Analysis* (1934) defined investing as:

?An operation in which, upon thorough analysis, **promises safety of principal and a satisfactory return.** Operations not meeting these requirements are speculative.?•

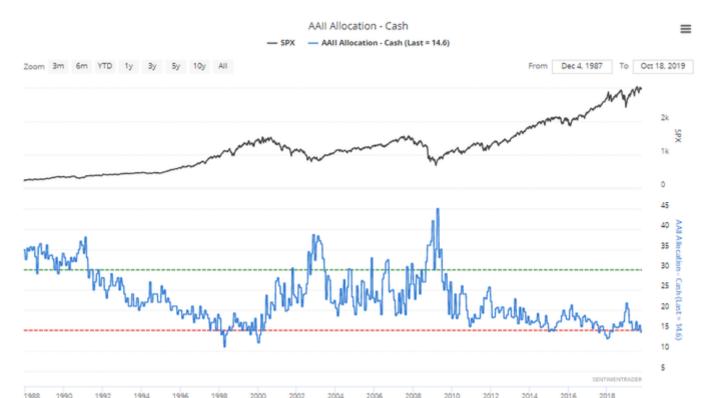

The problem is that today, the term *?investor?* is now being applied ubiquitously to anyone who participates in the stock market. As Graham noted later in *"The Intelligent Investor:"* 

?The newspaper employed the word ?investor? in these instances because, in the easy language of Wall Street, everyone who buys or sells a security has become an investor, regardless of what he buys, or for what purpose, or at what price, or whether for cash or on margin.?•

To understand "what happens next," one must understand the difference between "investment" and "speculation." While QE-4 may be driving stocks higher today based on a "whim," there are two very important difference between QE-4 and QE-1 or 2; 1) stocks are no longer undervalued or 2) under-owned.

S&P 500 Valuations									
Factors	Most Recent Value	Historical Percentile

Median EV to EBITDA (Ex-Financials)	12.6	94%							
Source: Bloomberg, Yale/Robert Shiller, John Hussman *Numb	ers as of July of 2019	©2019 Crescat Capital LLC							

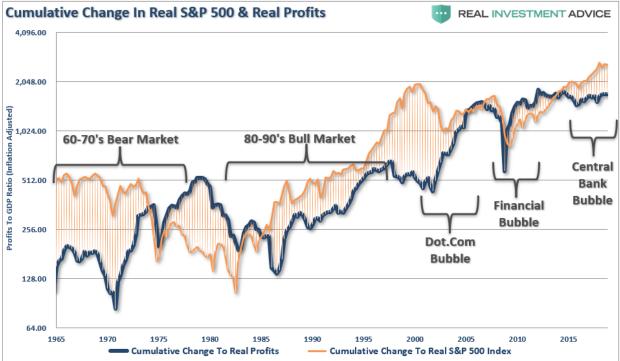

"With cash levels at the lowest level since 1997, and equity allocations near the highest levels since 1999 and 2007, it suggests investors are now functionally 'all in.'?•

With investors paying exceptionally high prices for equity ownership, expected forward returns becomes much more problematic. <u>As we addressed on Thursday:</u>

"The detachment of the stock market from underlying profitability guarantees poor future outcomes for investors. But, as has always been the case, the markets can certainly seem to 'remain irrational longer than logic would predict,' but it never lasts indefinitely. 'Profit margins are probably the most mean-reverting series in finance, and if profit margins do not mean-revert, then something has gone badly wrong with capitalism. If high profits do not attract competition, there is something wrong with the system, and it is not functioning properly.'? ? Jeremy Grantham

Another way to look at the issue of profits as it relates to the market is shown below. When we measure the cumulative change in the S&P 500 index as compared to the level of profits, we find again that when investors pay more than \$1 for a \$1 worth of profits there is an eventual mean reversion.

With investors paying more today than at any point in history for each \$1 of profit, the next mean reversion will be a humbling event.

That is just math. However, in the meantime, individuals are "speculating" within the markets based solely on the premise that a "greater fool" will be there when the time comes to sell. Unfortunately, that is rarely the case. There are virtually no measures of valuation which suggest making investments today, and holding them for the next 20-30 years, will work to any great degree. **This is the difference between** "investing" and "speculation." When you think about QE-4, as it relates to your portfolio, you have to consider the premise of valuations, margin of safety, and risk. Yes, the markets are indeed bullish by all measures, and holding risk will likely pay off in the short-term. (speculation)However, over the long-term, the ?house will always win.? (investing) If you need help or have questions, we are always glad to help. Just email me.

# Sector & Market Analysis:

Be sure and catch our updates on Major Markets (Monday) and Major Sectors (Tuesday) with updated buy/stop/sell levels

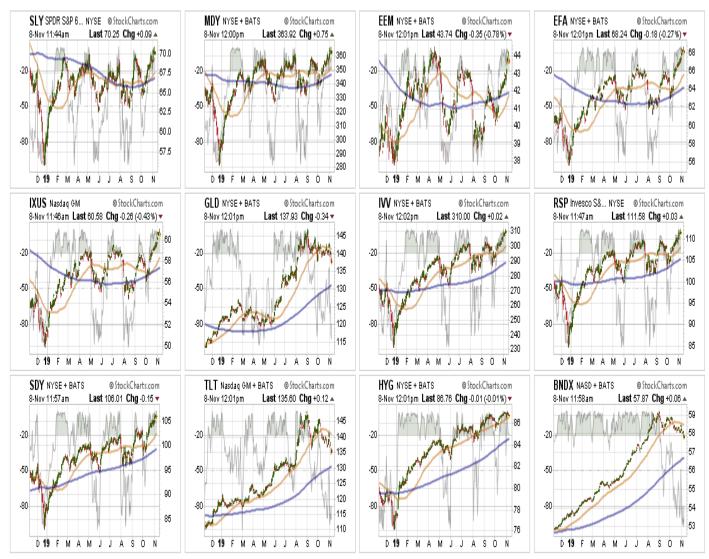

Sector-by-Sector

Improving ? Energy (XLE), Healthcare (XLV) The relative performance improvement of Healthcare relative to the S&P 500 lagged a bit this past week after breaking out to new highs. Energy also improved as the rotation to "value" continues but faltered at resistance on Friday at the 200-dma. Energy needs to break above the downtrend to become an attractive candidate for portfolios. Current Positions: Target weight XLV Outperforming ? Industrials (XLI), Financials (XLF) Financials have been running hard on Fed rate cuts and more QE, but rate cuts are, longerterm, not great for net-interest income margins on banks. Combined with the high level of corporate debt on their books, we remain cautious on the sector. But, with the breakout to new highs, we will are looking for some consolidation to add exposure to the sector which is extremely overbought currently. Industrials, which perform better when the Fed is active with QE, also broke out to new highs, and like Financials are extremely overbought. We are looking to add back to our position but need a bit of a correction or consolidation first. Current Positions:•1/2 weight XLI Weakening? Real Estate (XLRE), Staples (XLP), Technology (XLK), Utilities (XLU) After having taken profits in our defensive sectors, the rotation from defense to offense has picked up some steam. Utilities, Real Estates and Staples have all broken their 50-dmas and are FINALLY working off the extreme overbought condition that existed. This is good news and will allow us to buy additional exposure to the sectors at cheaper prices. Technology broke out to all-time highs, which is bullish for now, but, as with most running sectors of the market, is back to extremely overbought. Hold positions for now but be patient on adding new positions as we will likely get a better opportunity soon. Current **Position:** *Farget weight XLK, XLRE, XLU, XLP* **Lagging ? Basic Materials (XLB), Discretionary** (XLY), Communications (XLC) Basic Materials broke out to new highs as well, following Industrials, and we expect to see better performance as money rotates into the sector. Be patient as, just like the other offensive sectors, the market is VERY overbought. Communications has lagged, but also finally broke out to new highs. We are looking to add to our holdings of Materials

and Communications, but these sectors are also currently extremely overbought so be patient for now. **Current Position:** 1/2 weight XLB, Target weight XLC

### Market By Market

Small-Cap (SLY) and Mid Cap (MDY) ? Small- and Mid-caps have finally broken out of the previous ranges which suggests higher highs to come. This aligns with our commentary above about the sectors which perform the best under QE programs. However, both markets are EXTREMELY overbought currently. Be patient for the right entry point. Current Position: No position Emerging, International (EEM) & Total International Markets (EFA) The same advice goes for Emerging and International Markets, which we have been out of portfolios for several weeks due to lack of performance. These markets rallied recently on news of "more QE." and finally broke above important resistance. However, these markets are sensitive to the US Dollar which is showing some strength. With both markets EXTREMELY overbought currently, be patient for the right entry point. Current Position: No Position Dividends (VYM), Market (IVV), and Equal Weight (RSP)•? These positions are our long-term?core?•positions for the portfolio given that over the long-term markets do rise with economic growth and inflation. Currently, the short-term bullish trend is positive, and our core positions are providing the Pbase? around which we overweight/underweight our allocations based on our outlook. Be aware that all of our core positions are VERY overbought. A short-term correction or consolidation is likely before a further advance can be made. Current Position: RSP, VYM, IVV Gold (GLD) ? With QE-4 in play, the most defensive of sectors got hit last week. Gold is one of those sectors, and after taking profits, Gold broke support at the \$140 level. Next support is \$135 and stops should be placed on all positions at \$130. Gold is very oversold so a tradeable opportunity is approaching. Current

**Position:** GDX (Gold Miners), IAU (Gold) **Bonds (TLT)** ?•Bonds are now back to extremely oversold. This rise in yields was expected, which is why we added a "*steepner trade*" to our portfolios. Given that we improved our credit quality and shortened duration previously, we are holding our positions for now. We have tightened up our stops. Stay long current positions for now, and look for an opportunity to add to holdings. **Current Positions:** DBLTX, SHY, IEF

### **Portfolio/Client Update:**

Over the last couple of weeks we have been discussing the need to cautiously, and opportunistically add exposure to portfolios. The reason for the increase is simply a function of current market momentum and the fact the Fed is back into the "QE game." We have been constantly reviewing portfolios and markets looking for right opportunities. Currently, the market is extremely overbought which limits our ability to add "broad market" exposures. We are waiting for a brief market pullback or consolidation to add exposure to ETF Models in small and mid-capitalization markets, basic materials, industrials, financials and energy. These additions will

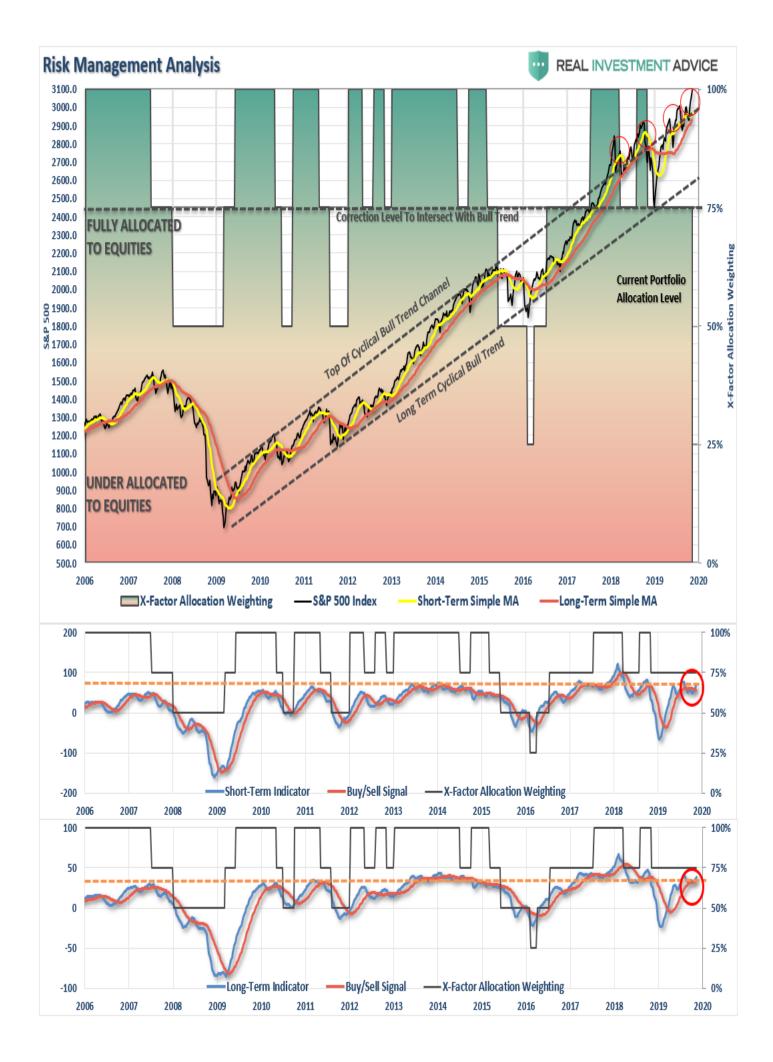

increase our overall allocation towards equity risk as we head into the end of the year. **These are NOT permanent additions, but rather opportunistic positions to potentially add some "alpha generation" to portfolios over the next couple of months.** We will be carrying tight stops and re-evaluating the holdings regularly for adjustments. In the Equity model, as noted below we were able to pick off some very beaten up stocks we have been watching for a while, and we trimmed off some issues which were under pressure from the markets rotation to offense from defense. We are actively looking to slowly increase our equity exposure modestly to "rent whatever rally" we may get from the "QE-4."•

- New clients: Please contact your adviser with any questions.•
- Equity Model: Sold YUM, MDLZ. Bought KHC, ABBV, XOM, MU, IEF
- ETF Model: Bought IEF

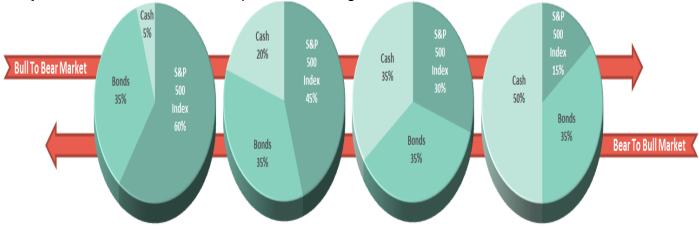

Note for new clients: It is important to understand that when we add to our equity allocations, ALL purchases are initially?trades?•that can, and will, be closed out quickly if they fail to work as anticipated. This is why we?step?•into positions initially. Once a?trade?•begins to work as anticipated, it is then brought to the appropriate portfolio weight and becomes a long-term investment. We will unwind these actions either by reducing, selling, or hedging if the market environment changes for the worse.

# THE REAL 401k PLAN MANAGER

A Conservative Strategy For Long-Term Investors

There are 4-steps to allocation changes based on 25% reduction increments. As noted in the chart above a 100% allocation level is equal to 60% stocks. I never advocate being 100% out of the market as it is far too difficult to reverse course when the market changes from a negative to a positive trend. Emotions keep us from taking the correct action.

### Watch Your Step Getting On The Bull

### Last week we noted:

"Given the 'bulls' upper-hand heading into the end of the year, we looking to increase our equity exposure slowly. Given the markets tend to pullback just before Thanksgiving, and during the second week of December, we will have a better opportunity to increase allocations if we are patient. We need to see a bit of a pullback to reduce the rather excessive extension of the market above the 200-dma, but a pullback that doesn't break back below the previous highs. Such action will confirm the breakout and suggest our target of 3300 is attainable."

Please review the chart above. While we are indeed looking to increase equity allocations, thre are reasons to remain cautious. With the market once again pushing above it's cyclical bullish trend line, and testing the cycle trend highs from 2007, the risk of a short-term correction action is elevated. Such a correction will provide a much better entry point to add risk to portfolios accordingly. This week, continue making adjustments to prepare to opportunistically increase equity exposure on a pullback which doesn't fail at support levels.

- If you are **overweight**•equities- Hold current positions.
- If you are underweight equities rebalance portfolios to target weights
- If at target weight equities, hold positioning and look for a pullback to increase exposure.

Understand this increase could well be short-lived. The markets have been in a very long consolidation process and the breakout to the upside is indeed bullish. However, we must counterbalance that view with the simple reality we are VERY long in the current economic and market cycle which is where *"unexpected"* events have destroyed capital in the past. If you need help after reading the alert; do not hesitate to <u>contact me</u>.

### 401k Plan Manager Beta Is Live

Become a <u>RIA PRO subscriber</u> and be part of our "*Break It Early Testing Associate*" group by using CODE: 401 (You get your first 30-days free) The code will give you access to the entire site during the 401k-BETA testing process, so not only will you get to help us work out the bugs on the 401k plan manager, you can submit your comments about the rest of the site as well. We are building models specific to company plans. So, if you would like to see your company

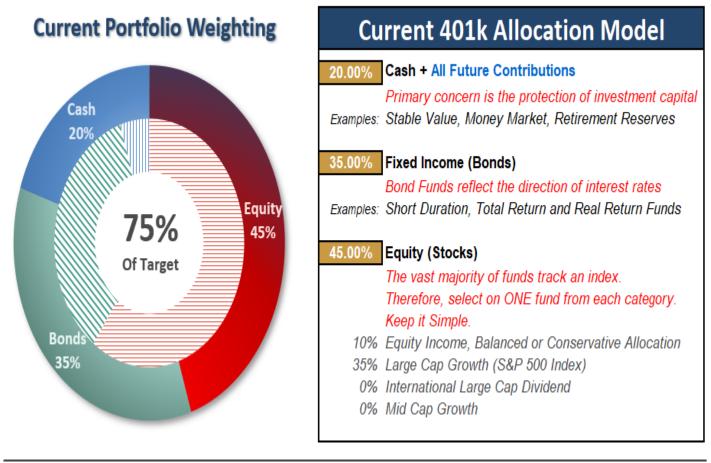

plan included specifically, send me the following:

- Name of the company
- Plan Sponsor
- A print out of your plan choices. (Fund Symbol and Fund Name)

I have gotten quite a few plans, so keep sending them and I will include as many as we can. If you would like to offer our service to your employees at a deeply discounted corporate rate, please contact me.

### **Current 401-k Allocation Model**

The 401k plan allocation plan below follows the K.I.S.S. principle. By keeping the allocation extremely simplified it allows for better control of the allocation and a closer tracking to the benchmark objective over time. *(If you want to make it more complicated you can, however, statistics show that simply adding more funds does not increase performance to any great degree.)* 

Model performance is based on a two-asset model of stocks and bonds relative to the weighting changes made each week in the newsletter. This is strictly for informational and educational purposes only and should not be relied upon for any reason. Past performance is not a guarantee of future results. Use at your own risk and peril.•
